Package sc2ranks Procedural Elements

sc2ranks.php

This file contains a basic class that handles interaction when generating requests and pulling data back from the sc2ranks.com API. Uses the json interface and the built in PHP json deserializer.

- **Package** sc2ranks
- **Author** Ameer Ayoub < ameer.ayoub@gmail.com>
- **Version** 0.3.3

Package sc2ranks Classes

Class sc2ranks_request

[line 17]

The main class that wraps the requests, all interaction with the API is done through this class, see the example for an example implementation of how to use this class.

- **Package** sc2ranks

Constructor *void* function sc2ranks_request::__construct([\$site_key = null], [\$method = "fopen"]) [line 100]

Function Parameters:

- *string* **\$site_key** optional sitekey to use with request, defaults to the value of `$_SERVER['SERVER_NAME']`.
- *string* **\$method** the method to grab url contents, either `curl` or `fopen` (for `file_get_contents`).

Constructor

object the function sc2ranks_request::get_bracket_data([\$response_object = null], [\$bracket = 1]) [line 292]

Function Parameters:

- *object* **\$response_object** optional response object, defaults to `new stdClass`.
- *int* **\$bracket** optional bracket number, defaults to 1, a bracket

Returns the team ranking object for a particular bracket.

- **Access** public

object the function sc2ranks_request::get_character_data(\$name, \$code, [\$region = "us"]) [line 184]

Function Parameters:

- *string* **\$name** character name
- *string|int* **\$code** 3 digit character code
- *string* **\$region** optional region information, defaults to US

Returns the deserialized character data object from the info provided to the function.

- **Access** public

object the function sc2ranks_request::get_character_data_by_bnet(\$name, \$bnet, [\$region = "us"]) [line 272]

Function Parameters:

- *string* **\$name** character name
- *string|int* **\$bnet** bnet ID code
- *string* **\$region** optional region information, defaults to US

Returns the deserialized character data object from the info provided to the function.

- **Access** public

object the function sc2ranks_request::get_character_data_by_profile(\$name, \$subtype, \$value, [\$type = "1t"], [\$region = "us"]) [line 250]

Function Parameters:

- *string* **\$name** character name
- *string* **\$subtype** the subtype of the profile search; division, points, etc.
- *string* **\$value** the value corresponding to the subtype; Thor Xi, 1700, etc.
- *string* **\$type** optional type information, defaults to 1v1 team
- *string* **\$region** optional region information, defaults to US

Returns the deserialized character data object from the info provided to the function.

- **Access** public

\$object function sc2ranks_request::get_latest_map_usage([\$response_object = null]) [*line 217*]

Function Parameters:

- *object* **\$response_object** optional response object, defaults

Returns the latest map usage statistics

- **Access** public

object deserialized function sc2ranks_request::get_map_data(\$map_id) [*line 201*]

Function Parameters:

- *int* **\$map_id** the map id to get data for

Gets map usage data from sc2ranks.com

- **Access** public

boolean function sc2ranks_request::is_json_last_error_enabled() [*line 346*]

Returns whether or not json_last_error is enabled

- **Access** public

int|object the function sc2ranks_request::json_last_error() [*line 318*]

Returns the last json error if supported, otherwise returns null

- [Link json_last_error documentation](#)
- **Access** public

string function sc2ranks_request::last_request() [*line 330*]

Returns the last request url string

- **Access** public

object the function sc2ranks_request::last_response() [*line 338*]

Returns the last repsonse object

- **Access** public

void function sc2ranks_request::__destruct() [*line 117*]

Destructor

Just cleans up the cURL session if we used it
